WORK EXPERIENCE

Software Engineer

2025 – Present

Rilla

- Designed and implemented the core **Stripe**-based payment infrastructure using **Express** and **TypeScript** to support in-product billing, processing payments totalling **over \$2 million** to date.
- Built self-serve payment flows with web and mobile components in **React**, enabling customers to subscribe and manage billing directly within the product and resulting in a **60% reduction in manual sales-assisted billing**.
- Implemented robust fallback and dispatch policies for the livestreaming orchestration **AWS Lambda** service in **Python**. Resulted in a **95% reduction** in the number of livestream crashes, failures, and disconnections.
- Leveraged **OpenAI** LLM calls in the livestreaming product to detect and notify users of key moments in a conversation in real time. The introduction of this feature **increased the clickthrough rate of livestreams by 60%**.
- Conducted **A/B testing** on the livestreaming webapp product to increase the week over week retention. Retention numbers were evaluated using custom **Grafana** and **MixPanel** graphs. Improved the week over week retention by over **3x**, from **12% to over 40%**.

Software Engineer

2024 – 2025

Relay

- Led the design and technical discussions of a new integration system that would allow users to seamlessly integrate with 3rd party services (e.g. **Intuit Quickbooks**, **Xero**, **Gusto**, etc). Utilization of integration features **increased by 20%** compared to previously.
- Designed and implemented a new ingestion system using **AWS Lambda**, **S3**, and **DynamoDB** to enable users to directly upload bills onto our platform. This new workflow **increased the use of our bill pay feature by 50%**.
- Overhauled the onboarding flow of our expense management service using **React** and **TypeScript** to increase our conversion rate. The completion rate of the new onboarding flow was **45% higher** than the old design.
- Closely monitored the **Datadog** logs in the alerts channel to keep a pulse on the health of our services. Tickets would be created and worked on for frequently repeating errors to continuously improve our system, reduce technical debt, and reduce noise. The frequency of alerts was **reduced by about 20%**.
- Collaborated with cross-functional teams and product designers to create an in-house frontend component library using **React** and **Tailwind**. All teams have begun adopting the component library, reducing cross-team UI inconsistency and accelerating feature development.

Software Engineer

2022 – 2024

Laserfiche

- Migrated our services from **AWS EC2** instances to a **Kubernetes**-based architecture utilizing **AWS SQS** queues and **AWS SNS** topics to improve the user experience and scalability of our application. Users were able to get instant feedback upon making requests, and the new service has not dropped a single request since the migration.
- Enhanced the performance of two **C#** microservices that made requests to our **PostgreSQL** database by implementing batch and asynchronous **RESTful APIs**. Our biggest clients with more than 20,000 users observed a **runtime reduction of 93%** when performing large-scale operations.
- Implemented a user feedback system in **Python** and deployed via **AWS Lambda** functions. The system stored messages in **AWS Redshift** and **S3**, and allowed users to attach image and GIF files. After testing, the system was deployed to all user-facing products and is the primary way that we gather feedback from clients.
- Created an internal web application using **React** and **Flask**, enabling non-technical users to query and visualize Redshift event data via an intuitive UI with drop-down filters. Managed the deployment with **Docker** containers, using **Nginx** as the reverse proxy for efficient application delivery.

EDUCATION

Master of Data Analytics

Western University · Ontario, Canada · 2020

Bachelor of Medical Science, Biochemistry of Infection and Immunity

Western University · Ontario, Canada · 2019

TECHNICAL SKILLS

Programming Languages: Python, TypeScript/JavaScript, C#, SQL, Bash, C

Frameworks & Libraries: React, Redux, Tailwind, Express, RxJS, Flask, Django, Jotai, Angular, Vue, Entity Framework

Tools & Technologies: Kubernetes, PostgreSQL, Node, Docker, Redshift, S3, DynamoDB, Terraform, Nginx, Datadog, Kibana, Grafana, Git
